The information contained herein is intended to provide general guidance only. As with any diagnosis or treatment you should use clinical discretion with each patient based on a complete evaluation of the patient, including history, physical exam and presentation, and laboratory data. With respect to any drug therapy or monitoring program, you should refer to a product insert, for complete description of dosage, indications, interactions, and cautions, Diagnosis, treatment, and monitoring should be patient specific and is the responsibility of the veterinarian providing primary care.

II Oc

- To identify strategies to avoid complications from otitis
- To understand what information is provided in the microbiology report and how it can be used in treatment of otitis
- To develop treatment regimens adapted to the individual patient
- To recognize the role of analgesia in the management of ear disease

Otitis

Very common clinical presentation

Common reason to change practice

Acute vs chronic

Unilateral vs bilateral

Can be extremely painful !

→ fear aggression/avoidance common!

Otitis clinical signs

Head shaking

Smell

Scratching ear

Acute moist dermatitis
behind ear

Head tilt

Rubbing ear

Increased discharge

Pain

Fear aggression

Behavioural changes

→ Get it right first time!

Dermatological Examination

Palpate ear canal

Otic discharge

- Brown coffee ground
 - Ear mites
- Pale yellow waxy
 - cocci, yeast, demodex
- Pale brown waxy
 - cocci, yeast
- Purulent malodorous
 - Pseudomonas
- Black watery or thick
 - Pseudomonas
- Thick chocolate colour
 - cornification defect/Malassezia & biofilm

Otoscopy

- Important way to examine patients with otitis
- Ask owners to train dogs from puppyhood
- Use in conjunction with other techniques (cytology)

- Warm up cone
- Nose down, pinna up

- Might require analgesia/sedation/GA if painful

- Pre-treatment with GCS to “open up” if needed

Pseudomonas

Cytology- Materials

Good quality microscope

Stain (Romanowsky-type, Methylene blue)

Immersion oil

Slides, cover slips

Cotton buds

Gloved finger

If patient head shy/fear aggressive

Massage ears

Distract

Slip finger in

Dab onto slide

Organisms

- Which type?
- Bacteria/yeast?
- Cocci/rods?
- Normal numbers?
- Infection/overgrowth?

Cytology vs culture/sensitivity

Cytology: for (almost) every case

C&S:

- when rods are seen
- when Tx not effective
- When middle ear disease present (systemic AB)
- With unusual organism morphology

C&S cannot replace cytology

| Organism | Gram | Shape | Size |
|--|--------|-------|-------|
| and soft tissue* | +G | 0 | +10 |
| " | +G, 25 | 0.5 | +1 |
| " | +G | 10 | +32 |
| otic soft tissue and soft tissue* | +G, 25 | 0.5 | +1 |
| otic soft tissue* | +G | 10 | +32 |
| endocarditis | +G | | +10 |
| Staphylococcus | +G, 12 | | +0.25 |
| and soft tissue) | +G, 5 | 1 | +2 |
| (e) | +G | 4 | +0 |
| (e) | +G | 4 | +0 |
| meningitis | +G | 0 | +10 |
| Pseudomonas | +G | 10 | +32 |
| skin and soft tissue) | +G | 4 | +0 |
| (e) | +G | | +32 |
| (e) | +G | 10 | +32 |
| otic gran positive | +G, 5 | 1-2 | +0 |
| otic gran negative | +G | 2 | +0 |
| positive respiratory, skin, and soft tissue) | +G, 12 | 0.25 | +0.5 |
| pyogenic (e) | +G | 0 | +10 |

| erythema | +G, 5 | 1-4 | +0 |
| Typhoid | +G | 4 | +0 |
| enteric gran-negative | +G | 4 | +0 |
| enteric Staphylococcus | +G | 0 | +10 |
| enteric gran-negative | +G | 4 | +0 |
| Widal test | +G | 2 | +0 |
| Widal test (skin and soft tissue) | +G, 5 | 1 | +2 |

We can have discordant results ...

Bacteria +/- WBC+
Culture negative

- Other causes of inflammation
- Bacteria nonviable
 - AM use
 - Extreme conditions (e.g. Temp; pH)
 - Lack of growth media
 - WBC inhibition
- "Pseudobacteria"
- Contaminated reagents
- Non-significant growth

Bacteria - / WBC-
Culture positive

- Low bacterial numbers on cytology
- Lack of inflammation/reduced WBC migration
- Bacteria obscured by debris
- Growth of contaminants/commensal flora
- Culture is more sensitive

Is Culture Beneficial?

IDEXX SERVICES: CANA, EARSW
 SAMPLES RECEIVED: Pink cap e-swab

MICROBIOLOGY

*Anaerobic Culture ^a Moderate growth mixed anaerobes

*Site: BOTH EARS :

Aerobic Culture - Ear

Isolate 1 Profuse growth: *Pseudomonas aeruginosa*

| Antibiotic | Result | MIC | Sensitivity Range | | |
|----------------|--------------|-------|-------------------|---------|----|
| *Amikacin | SENSITIVE | <=2 | 2 | Ssssir | 64 |
| *Gentamicin | SENSITIVE | <=1 | 1 | Sssir | 16 |
| *Ciprofloxacin | SENSITIVE | 0.25 | 0.06 | ssSssir | 4 |
| *Enrofloxacin | Intermediate | 1 | 0.12 | ssslir | 4 |
| *Marbofloxacin | SENSITIVE | <=0.5 | 0.5 | Ssir | 4 |
| *Polymixin B | SENSITIVE | 1 | 0.25 | ssSsrrr | 16 |
| *Ofloxacin | SENSITIVE | | | | |

in mixed bacterial growth.

- ASTs are based on systemic breakpoints
- The results can be poorly predictive of the response to topical treatment.
 - If R on AST may respond in vivo due to high concentration that can be achieved on site
 - If S on AST may not respond in vivo due to local factors (e.g. inflammation, biofilm, ear stenosis, etc)
- May be useful with bacilli infection (e.g. *Pseudomonas* vs *Enterobacterales* vs *Corynebacteria*)

Antimicrobial Susceptibility Testing

- Why do we do it?
 - To predict outcome of therapy
 - But often we already started therapy – “why is it not working?”
 - Two types of resistance
 - Intrinsic/innate/inherent – PSEUDOMONAS have many....
 - Acquired
 - Because we know AMR is increasing
- Disclaimer
 - Testing is still only a guideline to treatment
 - Not all organs/systems behave the same
 - Not all patients have the same AM distribution/metabolism
 - Patient response ultimately confirms adequacy of treatment

Is Culture Beneficial?

Ear Aerobic Culture

Isolate 1

Profuse growth: *Pseudomonas aeruginosa*

| Antibiotic | Result | MIC |
|---------------------------------|--------------|-------|
| ----- | ----- | ----- |
| Ampicillin (1) | Resistant | N/A |
| Amoxicillin-Clavulanic acid (1) | Resistant | N/A |
| Enrofloxacin (2) | Intermediate | 1 |
| Gentamicin (2) | Resistant | >=16 |
| Clindamycin (1) | Resistant | N/A |
| Amikacin (2) | Resistant | >=64 |
| Tobramycin (2) | Resistant | |
| Polymyxin B (3) | Intermediate | 1 |
| Ofloxacin (2) | SENSITIVE | |
| Cephalexin (1) | Resistant | N/A |
| Marbofloxacin (2) | SENSITIVE | 1 |
| Cefovecin (2) | Resistant | N/A |
| Ciprofloxacin (2) | SENSITIVE | 0.5 |

Standardised susceptibility tests do not reflect in vivo activity of topical antibiotics due to the high levels achieved in the target site with topical administration. Please note that topical treatment with the antimicrobials listed as intermediate (e.g. Polymyxin B) may be effective in this case given the high concentrations achieved at the site.

WHAT IS A MIC?

- Minimum Inhibitory Concentration
- is the lowest concentration (in $\mu\text{g/ml}$) of an antibiotic that inhibits the growth of a given strain of bacteria.

WHAT ARE BREAKPOINTS?

- Cut off between two different populations
 - Wild type and non-wild type
 - Susceptible and Resistant isolates
- Different types
 - ECOFFs
 - Clinical breakpoints

What about topical breakpoints?

- Still not available in Veterinary Medicine

In the absence of clinical data on outcome related to MIC of infecting organisms, EUCAST has not been able to determine relevant clinical breakpoints for topical use of antimicrobial agents. Laboratories are advised to either use the regular breakpoints or the cut-off values listed below to distinguish between organisms without and with acquired resistance mechanisms.

• EUCAST Guidelines

| Organisms | Screening cut-off values for the detection and reporting of phenotypic resistance. Report resistant (R) for isolates with MIC above the cut-off value. Otherwise report susceptible (S). | | <u>Gentamicin</u> | <u>Tobramycin</u> | <u>Ciprofloxacin</u> | <u>Levofloxacin</u> | <u>Ofloxacin</u> | Chloramphenicol | <u>Colistin (for polymyxin B)</u> | Neomycin (framycetin) |
|---------------|--|--------|-------------------|-------------------|----------------------|---------------------|------------------|-----------------|-----------------------------------|-----------------------|
| P. aeruginosa | Topical EUCAST | (mg/L) | 8 | 2 | 0.5 | 2 | 2 | ND | 4 | ND |
| P. aeruginosa | ECOFF EUCAST | (mg/L) | 8 | 2 | 0.5 | 2 | 4 | ND | 4 | ND |
| | CLSI VET01S-Ed7 S | (mg/L) | ≤ 2 | ≤ 1 | NA | ≤ 1 | NA | NA | NA | NA |
| | CLSI VET01S-Ed7 R | (mg/L) | ≥ 8 | ≥ 4 | NA | ≥ 4 | NA | NA | NA | NA |

Pseudomonas spp in Canine otitis

- Not part of the normal flora and not an obligate pathogen
- Prior dysbiosis may predispose to ear infections

- Biofilm formation in >40% of cases
- MDR reported in 13-35% of isolates

- Rates of resistance vary across countries and change across time

Goals of therapy

- Treat infection
- Remove discharge
- Analgesia
- Reduce chronic & perpetuating changes
- Avoid relapse
- Identify primary disease
- Avoid side effects

Analgesia

- Is important!
- Avoids future issues
- Avoids behavioural problems
- Increases compliance, particularly future compliance
- E.g. Gabapentin off label

- Long-acting medications

Determine primary disease

Elimination diet?

- How?
- How long?

Environmental allergy testing

Blood tests

Parasitidal diagnostic therapy

Ear flush/remove debris

Cleaning at home → most cases

GA flush →

- if severe disease
- copious discharge
- ?TM intact?
- Biofilm
- Ceruminoly

Aim:

- Remove debris
- Examine TM

middle ear if necessary
diagnostic & therapeutic

Client education/follow up

- Crucial!
- Show how to clean
- Written instructions
 - Increases compliance
- Set expectations
- Allergy: life long disease
- Treatment duration

- Quality of life!
- Follow up visits depending on severity
- Maintenance therapy
- Long term topical steroids
- Warn about intermittent use of AB drops → resistance/AB stewardship
